

CFS System

Chemical Filling Stations

Key Features

- Easy Wall Installation
- Lockable Enclosure
- PVC-U suction lance with foot valve
- Air Operated Double Diaphragm pump
- Leakage jerrycan with optional level detection
- Multiple operation options
- Overfilling prevention
- Internet option, to monitor your analog level measurement from the fixed tank

Application

The CFS system ensures a safe and easy filling of your chemical tanks. This unit is installed next to your day tanks, or fixed chemical tanks.

It includes a controller, air operated diaphragm pump with control valve in a lockable enclosure, suction tubing and suction lance with a jerrycan to catch any liquid from the suction lance, when not in use.

The new chemical can be brought on a pallet next to the unit. Just insert the suction lance into the new tank and start filling your fixed tank.

Connect your high level contact or analog level measurement from your fixed tank to the controller and it will prevent overfilling by shutting off the diaphragm pump.
