I. Introduction

The MegaTronXS microprocessor-based controllers are designed to provide a wide range of control functions for recirculating water treatment systems. The controller is programmed through a front panel keypad and can be configured to provide a customized control system for your application. Your particular unit's functions can be determined by comparing the units' model number to the Model Numbering table listed below.

Model Numbering

MegaTronXS units have several base system control functions and unit optional features. Your unit may be supplied with one or more of the features described in this manual. To determine what features apply to your unit, check the model number label located on the controller enclosure.

Base System Control Functions
C - Tower Conductivity Control
B2 - Boiler No Temp Conductivity
M - Make-up / Misc Conductivity
P - pH Control
Q - Dual pH Control
R - ORP Control
F1 to **F5**- Chemical Feed Timers
E - Flow Switch

Whole Unit Optional Features
A - Conduit Connections (115 VAC)
A3 - Liquid tights only for (220-240 VAC)
H – Internet communications card
H11 – Internet card with Modbus TCP/IP
H21 – Internet card with BACnet TCP/IP
N4 - 4-20mA inputs (four)
O4 - 4-20mA outputs (four)
W1 - 1 auxiliary flow input for a bleed flow alarm
W4 - Auxiliary Flow Meter Inputs (four)
Y - ETL Agency Listing / Approvals

Model numbers start **XS** followed by the System Control functions. A **dash** separates the whole unit options listed after all base system control functions. Example: **XSCPF3E-N4**.

Notice: Your unit may not have all the features and functions described in this manual. This list represents our most popular options, additional option codes are available. Consult a representative for more details.

Description of Unit
MegaTronXS controllers control a single recirculating water system including cooling tower and boiler applications and may have various features depending on the model number.

Control Functions
Each of these control functions are based on an analog input from a probe and will include user settable relay control settings along with a High and Low Alarm setting and Limit Timer. Each control function will include a control relay output. When the reading reaches the Set Point the control relay is activated until the reading changes by the Differential amount.

1. **System Conductivity** - The conductivity function of the controller is designed to monitor and control Total Dissolved Solids (TDS) in a recirculating system like a cooling tower or boiler in terms of electrical conductivity measured in MicroSiemens/cm. This control function is also referred to as Bleed.
2. **Make-up or Miscellaneous Conductivity** -This conductivity with the probe installed in the fresh make-up water line can be used to control the conductivity of the tower in terms of cycles of concentration by calculating the difference between the make-up water's conductivity and the system's conductivity. It can also be used to monitor another conductivity with no feed timers associated with it.
3. **pH** - The pH function monitors and controls pH on a scale of 0-14 pH units.
4. **ORP** - The ORP function monitors and controls ORP on a scale of +/- 1000 mV.

Chemical Feed Timers

Chemical feed timers are designed to automate the addition of various chemicals by activating a relay output. Multiple timers can be supplied depending upon the model number and each timer will include a relay output. All timers can be programmed to be one of the following types.

1. **Pulse Time** - Accepts pulses from a make-up water meter (supplied separately). It can accumulate 1-9,999 gallons before activating the timer to run.
2. **Feed with Bleed** - Activates the relay output simultaneously with the bleed and limits the amount of time the relay output will be on during the bleed cycle.
3. **Feed after Bleed** - Activates the relay output based on a user defined percentage of time based on the bleed off, another timer or digital input. The relay is activated after a bleed cycle and runs for the set percentage of that bleed cycle.
4. **Recycle** - The relay is continuously repeating a defined OFF cycle time and a user defined ON cycle time.
5. **28 Day** - The timer is based on a 28-day cycle, with four independent programmable feed cycles with prebleed and bleed lockout settings.

II.   Installation

Electrical Wiring

The MegaTron XS controller has an internal regulated fused power supply that will operate off of 90 to 250 VAC at 47 to 63 Hz on the incoming wiring. Each output relay is individually protected with a replaceable fuse. Relay outputs will equal incoming line voltage.

⚠ **CAUTION** ⚠
1. There are live circuits inside the controller even when the power switch on the front panel is in the OFF position. Never open the front panel without first disconnecting power from the outlet. Prewired controllers are supplied with an 8 foot, 18 AWG power cord with USA style plug. A #1 Phillips driver is required to open the front panel.
2. Low voltage signal wires (probes, flow switch, water meter, etc.) should never be run in conduit with high voltage (like 115VAC) wires.
3. Never attempt to land connections to the controller without first disconnecting power from the outlet.
4. Do not block access to disconnect power during mounting and installation.
5. The controller should be connected to its own isolated circuit breaker, and for best results, the ground should be a true earth ground, not shared. Any attempt to bypass the grounding will compromise the safety of users and property.
6. The electrical installation of the controller must be performed by trained personnel only and conform to all applicable National, State and Local codes.
7. Operation of this product in a manner not specified by the manufacturer may result in damage to equipment or persons.
8. Avoid mounting in locations that expose the controller to direct sunlight, vapors, vibration, liquid spills or extreme temperatures; less than 0°F (-17.8°C) or greater than 120°F (50°C). EMI(electromagnetic interference) from radio transmissions and electric motors can also cause damage or interference and should be avoided.

NOTE: Units should be ordered with the appropriate option to provide powered relays designed for the incoming/outgoing power.

Pre-Wired
Pre-wired units are supplied with a 16 AWG cable(s) with 3-wire grounded USA 115 volt plug for incoming power and 3-wire grounded receptacle cords for all control relay outputs also 16 AWG.

Conduit
Conduit units are predrilled at the factory and supplied with conduit knockouts for easy hard wiring to supplied detachable connectors on the relay card(s) located in the lower section of the controller. Remove the screws of the lower panel for access.

NOTES:
1.   **Do not drill holes in the upper section of enclosure.**
2.   All relays provide a N.O. and N.C. output.
3.   The control function that activates each relay output is pre-configured at the factory based on the options selected. To change relay activation, see on page 24.
4.   See page 34 for common bleed / blowdown valve wiring.
5.   Refer to label inside lower panel cover for specific relay board configuration supplied.
6.   Relays configured as "dry contact" should only have D.C. voltage ran through them. The GND connection point replaces the NEU when configured for dry contact. (Example: Use GND and N.O. for a normally open dry contact relay output.)
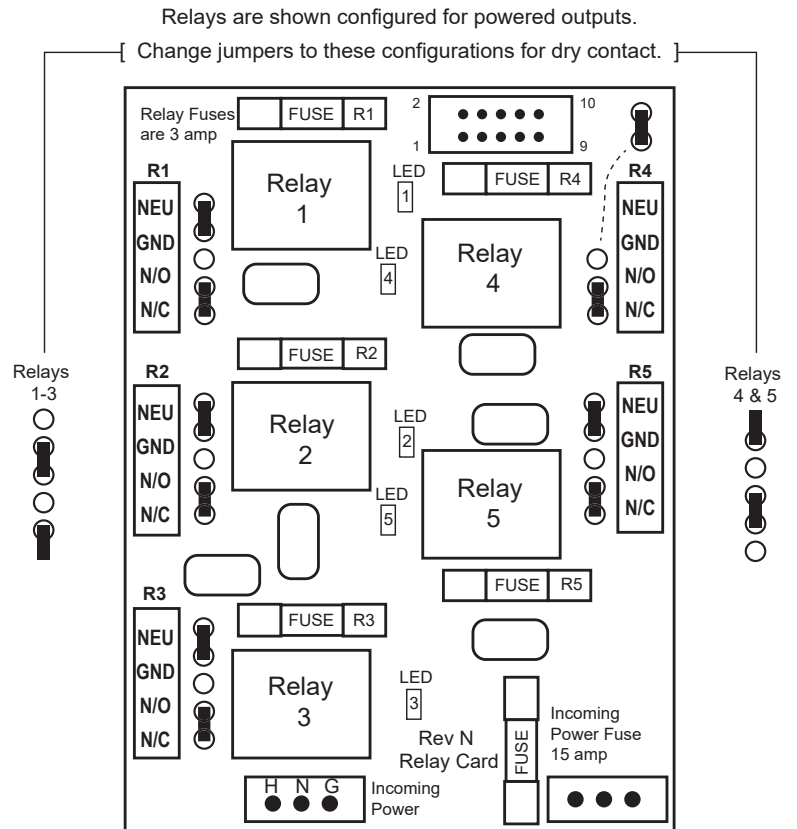

⚠ **WARNING:** If jumpers are not configured for dry contact, line voltage will be supplied.

4-20mA Output Card Wiring

A.   Isolated Configuration

For isolated 4-20mA outputs, an external power source for the loop must be supplied. JP4 and JP5 on the board must be jumpered for isolated, with an external power source supplied to the external VDC input. The external power source must not exceed 24 volts DC.

B.   Non-isolated Configuration

For non-isolated 4-20mA outputs, the controller will supply the power for the loop. JP4 and JP5 must be jumpered for non-isolated, and no connections are made to the external VDC points.

NOTE: The power for the mA output loop is always provided by the controller with either isolated or non-isolated configuration.

4-20mA Input Card Wiring

The 4-20mA input card requires that the external device sending the 4-20mA input signal(s) supply the power for the loop. The external power source must not exceed 24 volts DC.

NOTE: Older green versions of the 4 input cards supply +12 VDC and ground on the voltage terminals, and newer blue versions supply +12 and -12 VDC instead of ground on the "G" positions when configured for non-isolated voltage (the standard configuration).
NOTE: Units with only mA outputs may be provided with a card that has the four outputs at the bottom of the card or the top of the card, depending on version used.

Mounting Instructions

Select a mounting location that provides the operator easy access to the unit and a clear view of the controls through the cover of the controller. The location should be convenient to grounded electrical connections, the needed sample line plumbing, and should be on a stable vertical surface.

Electrode Installation

MegaTronXS controllers may come configured for various circulating water systems. Listed below are instructions for typical cooling tower and boiler installations. Your specific installation requirements may differ, but should conform to these instructions as much as possible for proper operation.

A.   Cooling Tower

The standard probe(s) and/or flow assembly for cooling tower installations is constructed of schedule 80 PVC and supplied with ¾" slip fittings for installing into a sample line. To ensure proper operation, the sample line must have a flow rate of 3-10 gpm. Inlet pressure must be higher than outlet pressure in order for water to flow past the electrode(s) to achieve the required rate. The probes are temperature compensated for increased accuracy.
NOTES:
1.   **Install an isolation valve on either side of the flow assembly so electrodes can be easily isolated for removal and cleaning.**
2.   **A line strainer is recommended upstream from the probes to protect against fouling and damage.**
3.   **Mount pH or ORP electrodes vertically.**
4.   **Green solution reference wire must be connected to either pH or ORP sensor. If both pH & ORP are present on the system card, only one solution reference connection is needed.**
5.   **Systems with a flow switch require a 2-3 gpm flow rate to operate outputs.**
WARNINGS:
1.   **Electrodes are O-ring sealed, which if damaged will cause a leak.**
2.   **Do not allow pH sensor tips to dry out, damage will occur.**
3.   **Do not exceed a water temperature range of 32°F-140°F (0°C-60°C).**
4.   **Do not exceed a maximum pressure of 125 psi (8.62 bar).**

B.   Boiler

Standard boiler electrodes have a MNPT stainless steel bushing and are supplied with a FNPT cross designed for mounting in the skimmer (surface) blowdown line.   Sampling of the boiler's water can be achieved using one of two typical plumbing configurations (continuous sampling or timed and/or sample & hold). For a successful installation, it is critical to observe the recommended distances and pipe sizes provided in the installation drawings.

For the best results, the electrode cross should be mounted in a 1" skimmer blowdown line within 4' of the boiler. Smaller line sizes and greater distances may affect the response time and accuracy of the electrode. A flow-throttling device downstream from the probe (within 24 inches) is required to ensure that the electrode is exposed to water and not steam. Properly installed and adjusted, this device will prevent flashing in the electrode chamber.

NOTES:
       1.   **Install a fully ported type of valve between the electrode and the boiler. This allows the electrode to be isolated for removal and cleaning.**
       2.   **A flushing line and 1/4 turn type ball valve should be installed in the bottom of the cross to periodically "flush" sediment from the electrode chamber.**
       3.   **Make sure the alignment arrows on the probe end up parallel to the flow for best performance.**

WARNINGS:
       1.   **The probe must be fully immersed in the system water to read correctly. Steam flashing will result in incorrect readings.**
       2.   **Do not exceed a maximum water temperature of 436°F (224°C)**
       3.   **Do not exceed a maximum pressure of 350 psi (24.1 bar)**
   **4.**   **A throttling device must be installed downstream from the electrode.**

Boiler Conductivity Electrodes

BE-4RTD and BE-32
Wiring Note: BE-4RTD probes require a 6-conductor cable from controller to probe, BE-32 probes only require a 2-conductor cable.

Typical Continuous Sampling Installation

Throttling device

gate or ball valve

1" Continuous blow down line

Electrically actuated blow down valve

1/2" pipe between probe and throttle device and flush valve

↑ → SET UP RUN ENTER HOME

↓ ← CANCEL HELP BACK

NUMBER Keys-   Used to enter new values in the SET UP mode and to access desired sub menus.

UP/DOWN -   Used to cycle through text options to find desired setting.

LEFT/RIGHT -   Used to cycle through text or setting options to find desired setting.

SET UP/RUN -   System initializes into RUN mode. Press this key to put the controller in SET UP
                      Mode and see HOME menu page.

ENTER -   Used to log a changed value into program.

HOME -   Used to go back to the HOME menu page.

CANCEL -   Used to cancel a pop-up screen if no change is desired.

HELP -   Used to access help screens.

BACK -   Used to go back to last menu screen viewed or clear values keyed in that are not
                      wanted.

The bottom right box in the RUN screen mode is a hot key that will take you directly to a particular menu screen. The default is the RELAY status menu, but this can be changed by navigating to the desired screen and pressing the HELP button. Follow the on-screen instructions to set the new hot key location.

IV. System Operation Overview

Operation

MegaTronXS controllers have two modes of operation, RUN and SET-UP.

RUN - This mode is for normal operation. In the RUN mode the display will show each system's parameters. If an alarm is present, the ALARM box will flash how many alarms are activated. No settings may be entered or changed in the RUN mode. Readings are updated every 6 seconds on the screen while in the RUN mode.

Note: Conductivity readings from timed sampling or sample and hold systems (typically boilers) are only updated at the end of a sampling period. Press the #2 key to force a sample and updated reading while in the RUN screen.

SET-UP - This mode is used to adjust settings and readings on the controller. To access the SET UP mode from the RUN screen, press the SETUP/RUN key.

Typical Start Up Instruction

Complete all installation steps before beginning this procedure. Ensure that all controlled devices (pumps, solenoid valves, etc.) are operational and connected to the controller. Open the isolation valves to allow water to pass through the sample stream assembly. Before beginning the startup procedure, familiarize yourself with the programming and operation of the system by reviewing the menus available. Use the keys of the controller to skim through all your options.

A.   Calibration

All MegaTronXS controllers are factory calibrated for temperature, conductivity, pH and ORP. All units are shipped with the date preset, and the clock set to your current time. These readings and settings should be verified for accuracy and adjusted as per the instructions listed below.

1. **Conductivity** - To calibrate the conductivity reading, remove the electrode from the line and wipe the flat surface with a clean cloth. Re-install the electrode and open the isolation valves to allow a sample across the probe. Be sure to allow the reading to stabilize for one minute. Select "SYSTEM COND" from the "CALIBRATION" menu. Then key in the corrected conductivity value. Press ENTER to log in that reading.

Note: Boiler probes must have a fresh hot sample. See page 16 for more details.

2. **pH** - Under normal operating conditions, pH calibration is achieved using the following steps. From the "CALIBRATION" menu, select "SYSTEM PH." Enter the correct pH value. Press ENTER to log in the new reading.

3. **ORP** - To calibrate ORP, from the CALIBRATION menu, select "SYSTEM ORP". Compare the displayed reading to the actual system ORP. If these readings do not match, key in the correct ORP value, and push ENTER.

There are limits to how much the calibration can be adjusted. The instrument will only accept new conductivity values which are from 1/3 to 8x the present reading. Any entry outside this range will cause a default to the original reading. If this happens, call 1-918-686-6211 for technical assistance.

V. Menu Navigation

To access the menus, press the Set Up / Run key on the front panel. This takes you to the Home menu. MegaTronXS controller's menus are easily navigated by pressing the associated number key next to a menu box on the screen. Once you have stepped through the sub menus to reach a point at which a value or selection is made, a Pop-up window will appear, prompting you to enter a desired value or selection.

NOTE: When entering new numeric values, enter all available digits (characters).

1.   Home Menu

```
          >HOME SETUP<

SETPOINTS               DATE/TIME
CALIBRATION             CONFIGURE
TIMERS                    HISTORY
CUSTOMIZE            WATER METER
ALARMS                    RELAYS
```

From the **HOME** menu select the desired menu.
The menu name explains what parameters can be programmed in the menu.

SETPOINTS -   Setting control set points for conductivity, temperature, pH and ORP.
CALIBRATION -   Calibrating conductivity, temperature, pH and ORP if present.
TIMERS -   Menu for selecting type and settings for all present feed timers.
CUSTOMIZE -   Giving the controller, each system, and all relays a user defined name.
ALARMS -   View current alarms.
DAY/TIME -   Menu for setting date and time.
CONFIGURE -   Menus for configuring passwords, relay activations, setting history interval, flow
                       switch, contrast, temperature scale.

HISTORY - Allows for view history on board in a graph form.
WATER METER - Menu for configuring water meter totalizing.
RELAYS - Menu for resetting accumulated "ON" times and manual relay activation.

2. Set Points

The same basic format is used for defining each available analog probe input's control parameters. Boiler conductivity systems will also have an additional menu step for programming the sampling method desired from continuous, timed or sample and hold.

```
        >SYSTEM 1 SET POINTS<

SYSTEM COND              mA OUT
SYSTEM TEMP               mA IN
SYSTEM pH           AUX INPUTS
SYSTEM ORP
```

SET POINTS - For setting the relay set points for the available analog probe readings such as conductivity, pH, ORP, or temperature.

NOTE: In the Setpoint pop-up screen, the direction (Rising or Falling) of the setpoint can also be set. Rising setpoints will activate the control relay when the probe reading rises above the setpoint, and will stay activated until the reading comes down by the amount of the differential. If set for Falling, the relay is activated when the probe reading falls below the setpoint, and stays on until the probe reading comes back up by the amount of the differential.

2.1 Set Point Options

```
      >SYSTEM 1 COND SETPOINT<

SET POINT          2nd SET POINT
DIFFERENTIAL
HIGH ALARM
LOW ALARM
LIMIT TIME
```

SET POINT - What reading turns the relay on.
DIFFERENTIAL - Amount reading changes by before the relay is turned off.
HIGH ALARM - What reading generates a High alarm.
LOW ALARM - What reading generates a Low alarm.
LIMIT TIMER - What amount of continuous bleeding will generate a time alarm notice. The bleed is not locked-out by this alarm.
2nd SET POINT - This valve is used if drum level one (D1) is in alarm.

Note: Each alarm value can also be set up to be displayed or not on the front screen, as well as remotely notified or not, if connected to the WebAdvantage server.

2.2 Make-up or Miscellaneous Conductivity

Tower systems with this option have an additional menu on the review page labeled SAMPLE METHOD. The sample method pop-up screen allows the user to select continuous or cycles control. With cycles selected under Settings a best and worst cycles value is attached to a best and worst make-up conductivity value. The controller will control the cycles proportionally between the two cycles values as the makeup conductivity changes between the two identified values.

```
      >SYSTEM 1 COND SETPOINT<

                        BEST MAKEUP
DIFFERENTIAL            BEST CYCLES
HIGH ALARM            WORST MAKEUP
LOW ALARM            WORST CYCLES
LIMIT TIME            SYSTEM MAX
```

BEST MAKEUP - Conductivity of best expected makeup water.
BEST CYCLES - Cycles desired with the best water.
WORST MAKEUP - Worst expected water.
WORST CYCLES - Cycles with the worst water.
SYSTEM MAX - A fixed conductivity set point that overrides the cycles setpoint, if reached.

Note: If continuous is selected the standard settings are used for system conductivity and the miscellaneous conductivity (labeled M COND) is the set points menus.

2.3   pH

The pH set point settings follow the same format as shown above in section 2.1.

```
        >SYSTEM 1 pH SETPOINT<

SET POINT                    INTERRUPT
DIFFERENTIAL           SET POINT 2
HIGH ALARM
LOW ALARM
LIMIT TIME
```

INTERRUPT - Allows the Interruption of pH control during bleed, other chemical feed, or both.

pH SET POINT 2 - Is only present on systems with Dual pH control option. It is a second set point for applications when an acid and caustic are required. Set Point 1 will be for feeding acid and Set Point 2 for feeding caustic.

Note: When the Limit Time value is met it will force off the control relay being driven by pH or ORP. To reset the limit timer and get the control relay active again, enter a new Limit Timer value.

2.4   ORP

The ORP set point settings follow the same format as shown above in section 2.1 and 2.3.

```
        >SYSTEM 1 ORP SETPOINT<

SET POINT                 SET POINT 2
DIFFERENTIAL           SETP2 NOTIFY
HIGH ALARM
LOW ALARM
LIMIT TIME
```

ORP SET POINT 2 - If a 28-day timer is interlocked to ORP, the ORP control will go off of SET POINT 2 during the 28-day timer's run time.

SETP2 NOTIFY - Allows for an alarm if SET POINT 2 is not reached during interlock.

Note: When the Limit Time value is met it will force off the control relay being driven by ORP. To reset the limit timer and get the control relay active again, enter a new Limit Timer value.

2.5   Boiler Conductivity

Conductivity on boiler systems can be configured for Timed Sampling, Sample and Hold, or Continuous, for the conductivity sampling method.

Timed sampling incorporates a sample timer which allows the boiler to be sampled at periodic intervals. Sample intervals are adjustable from 1 minute to 99 hours, 59 min. Sample duration (on-time) is adjustable from 1 second to 99 minutes, 59 seconds.

Sample and hold uses a sample timer for periodic sampling intervals. The unit will sample for its duration and then hold the blowdown valve closed for a settable period (hold time). The conductivity is checked at the end of the hold period; if additional blowdown is required, the blowdown valve is held open for a preset

amount of time (blowdown time). Then the sample cycle is repeated.

Pulse Sample allows the use of a defined "pulse" type feed timer to initiate a sample based on make-up water instead of the sample interval timer.

Continuous sample has a sample of boiler or condensate water go past the probe continuously. If the reading is above the set point, blowdown will continue until the set point has been satisfied.

```
      >SYSTEM 1 COND SETPOINT<

SET POINT              SAMPLE INT
DIFFERENTIAL           SAMPLE DUR
HIGH ALARM              HOLD TIME
LOW ALARM               BLOWDOWN
```

SET POINT - What reading turns the relay on
DIFFERENTIAL - Amount reading changes by before the relay is turned off.
HIGH ALARM - What reading generates a High alarm notification.
LOW ALARM - What reading generates a Low alarm notification.
SAMPLE INT - Period between samples.
SAMPLE DUR - How long a sample lasts.
HOLD TIME - How long a hold lasts.
BLOWDOWN - How long to blowdown if reading is above the set point after the hold. Hold repeated after BLOWDOWN time.

2.6   Aux Inputs

Auxiliary inputs are the digital inputs for optional Flow Switch and other digital inputs such as low drum level alarms. From these menus the user can set if they want each of the alarms Displayed, Remote Notification, both, or none.

```
   >SYSTEM 1 DIGITAL INPUTS ALARM<

ALARM NOTIFICATION          DIGITAL 1
FLOW SW = DISPLAY           DIGITAL 2
                            DISABLER
DIGITAL 1 = DISPLAY         DIGITAL 3
                            DIGITAL 4
HIGH ALARM
FLOW ALARM                  DIGITAL 5
LOW ALARM
```

Note: Digital inputs can have the direction selected between OPEN or CLOSED as the alarm polarity. If set for CLOSED, the input will be in alarm when it sees a closed contact.

2.6   4-20mA Out

Units with a 4-20mA output option will have a menu for setting up the 4-20mA output. The 4mA and 20mA values can be defined by giving the output proportioning capability, i.e., 4mA = a pH of 6.0 and 20mA = a pH of 8.0.

```
        >OUT 1 SETUP<

SIGNAL SOURCE
4mA VALUE
20mA VALUE
```

SIGNAL SOURCE - Select which probe reading the mA will use as its reading source.
4 mA VALUE - What the 4mA signal equals
20mA VALUE - What the 20mA signal equals on the assigned signal sources scale.

2.7   4-20mA Input

SET POINT - What reading turns the relay on.
DIFFERENTIAL - Amount reading changes by before the relay is turned off,
HIGH ALARM - What reading generates a High alarm notification.
LOW ALARM - What reading generates a Low alarm notification.
DISABLER - Selected input will disable High/LOW alarm notifications.

3. Calibration

Calibration is for adjusting the displayed value of a probes reading to match your tester or known solution. Pick the system or mA input first. From a particular system pick the probe to calibrate.

```
        >SYSTEM 1 CALIBRATION<

SYSTEM COND
SYSTEM TEMP
SYSTEM pH
SYSTEM ORP
```

CALIBRATION - For adjusting the actual reading values of the available analog probe inputs, such as conductivity, pH, ORP or temperature.

3.1 Conductivity Calibration

```
    >SYSTEM 1 COND CALIBRATION<

CALIBRATE            Cal Factor 1.10
RESET ZERO
```

CALIBRATE - With a clean probe inline with the system's water, enter the known (from a calibrated hand-held tester) value. **Note:** Never enter 0.
RESET ZERO - With the probe out of solution and dry enter a new zero point. **Note:** Probe must be dry!

NOTE: In the calibration pop-up window, the raw analog-to-digital (A/D) value will be displayed. A new calibration value should only be entered when the probe is sensing a stable A/D value. If the system is a boiler, the associated relay can be forced on in the pop-up to allow for a fresh hot sample. Boiler probes should have fresh hot water blown past them for a minimum of 2 minutes before calibrating. **The A/D reading has a range of 0 to 32,767. If it is at one end of the range or the other when trying to calibrate, something is wrong with the probe or wire run.**

3.2 pH and ORP Calibration

```
      >SYSTEM 1 pH CALIBRATION<

1 POINT CAL
2 POINT CAL
```

1 POINT - With a clean probe on-line seeing the system's water enter the known (tested from a calibrated hand-held tester) value.
2 POINT - Enter a known Low value with a clean probe in a buffer solution. Then enter a known High value with the clean probe in a buffer.

Notes: 1. Probes must be rinsed between buffers when doing a 2 Point calibration and given at least 30 seconds in solution to adjust to the buffer.
2. There must be at least 2 full pH points between buffer solutions. Using a buffer of 4 and 10 is the best procedure. ORP buffers should be at least 200 points apart.

3.3 4-20mA Output Calibration

```
    >CURRENT LOOP CALIBRATION<

OUTPUT 1
OUTPUT 2
```

4-20mA outputs can be calibrated to ensure that the output generated by the controller and received by the external device match. With a voltmeter connected

across the out and return wires (see page 7) of the
4-20mA output channel, to be calibrated, go into the output's Low or High calibration.

```
    >mA OUTPUT 1 CALIBRATION<

HIGH 4030
LOW 800
```

The number displayed in the Calibration dialog box can range from 0-4,095, with 800 equal to 0 mA output, and 4,030 equal to 20 mA. This number range of 0-4,095 is the raw digital to analog (D/A) values and is strictly used for a reference. The D/A numbers you get will vary based on your installation conditions.

```
    >mA OUTPUT 1 CALIBRATION<

  OUTPUT 1 CAL HIGH
  4000
  Use Up/Down arrows to change
  Use Enter to save value
```

While in the High or Low calibration pop-up screen, use the up and down arrows to change the output value being read with the voltmeter. Adjust the High value for the 20-mA reading and the Low value for the 4-mA value. Firmware version KA.16.03 and up have logic that suspends any control logic if the mA received is 50% below the stored 4mA value. A # will be placed in the RUN screen for any mA value in this invalid state.

3.4   4-20mA Input Calibration

4-20mA inputs can be calibrated to ensure that the input seen by the controller from the external device matches. It also allows for setting the 4-20mA input into a number range that relates to the value being read.

```
    >CURRENT LOOP CALIBRATION<

INPUT 1
INPUT 2
```

Select the Input to be calibrated.

```
    >mA INPUT 1 CALIBRATION<

20mA                        5500
4mA                         1100
MAX                          200
LOW                            0
OFFSET              FACTORY DEF.
```

The **20mA** and **4mA** values are where the controller's raw analog-to-digital value is adjusted to match a 20mA (full scale) and 4mA (bottom of scale) signal from the external device inputting the 4-20mA input. The external device must be connected to the controller and showing either full-scale or bottom-of-scale when calibrating each. The number shown along with either the 20mA or 4mA while calibrating is the raw A/D value and is only a reference. A 20mA input should be around 5,500, and 4mA around 1,100. If the A/D numbers are not in this range, check the input device.

The **MAX** and **LOW** calibration inputs are for telling the controller what to display for a 20mA input and a 4mA input. For example, if the input is a drum level sensor monitoring a 55-gallon drum, the value for MAX should be 55, and LOW should be 0. The controller then displays a number automatically ranging between 55 and 0 based on the input value. The units of measure (gallons for example) are set in the Customize menu from the Home page.

OFFSET - Changes the current displayed value of the 4-20mA input reading to allow for a manual 1pt

calibration of the displayed value.

FACTORY DEFAULT - If the 20mA or 4mA calibration has been incorrectly set (not at 4 or 20) this will reset the settings back to a factory value for 4 and 20.

4. Timers

A unit may have up to 5 selectable timers for each system on a controller. All timers are associated with their system, so for a % of post bleed timer looks at the bleed of that system.

```
        >SYSTEM 1 TIMERS<

TIMER 1
TIMER 2
TIMER 3
TIMER 4
TIMER 5
```

TIMERS - Select the type (28-day, pulse, limit, percent, recycle, percent of post bleed, or other event) as well as the run times of each timer available per system.

4.1 Timer Type Selection

A pop-up screen lets you scroll through the various timer types available.

```
     >SYSTEM 1 TIMER 1 SET UP<

     >SET TIMER TYPE (PULSE)<
            -> PULSE
   USE UP/DOWN KEYS TO CHANGE
      PRESS ENTER TO ACCEPT

  SET UP                TIMER TYPE
```

Pulse - A water meter activated timer.
Limit - Feed with bleed with a maximum run time or limit for one bleed cycle.
Recycle - A continuous recycle timer with ON and OFF settings.
Percent Post Bleed - For feed after bleed, for a settable percentage of the bleed time with a maximum run time.
28-Day - A biocide or event timer.

4.2 Timer Set Up

```
     >SYSTEM 1 TIMER 1 SET UP<

  TIMER TYPE:  PULSE
               GALLONS: 10
  RUN TIME     (MM:SS): 01:00
  INPUT:       WATER METER 1

  SET UP                TIMER TYPE
```

Each timer type selected will have its own unique Set Up sub menu with additional selections specific to the type of timer selected. The page displayed before entering the Set Up menu of a timer provides an overall review of the timer's current settings.

4.3 Pulse Timer

```
     >SYSTEM 1 TIMER 1 CHANGE<

ACCUMULATE
RUN TIME
METER INPUT              BLEED INTR
```

ACCUMULATE - The number of gallons or liters from water meter to count before activating timer.
RUN TIME - The amount of time for the timer to run
METER INPUT - Select water meter 1 or 2 for the timer's activation. Water meter 1 + 2 can be selected only if the meters have the same contact value.
BLEED INTR - Allows the pulse timer to be interrupted

during conductivity bleed. While interrupted, you can also define the maximum number of timer run cycles (1-9) to store for playback.

4.4   Recycle Timer

```
      >SYSTEM 1 TIMER 1 CHANGE<

ON CYCLE  (HH:MM)
OFF CYCLE  (HH:MM)
OFF TIMER (HH:MM:SS): 0:10:40
```

ON CYCLE - The amount of the defined time that the timer is to be on.
OFF CYCLE - The amount of time that the cycle will be off.
ON/OFF TIMER - This is the displayed countdown of time for the cycle the timer is in.

4.5   Post Bleed Timer

```
      >SYSTEM 1 TIMER 1 CHANGE<

% OF BLEED
LIMIT TIME
SOURCE
```

% of BLEED - The % of the post bleed time or other source time that you want the timer to run.
LIMIT TIMER - The limit timer is a safety feature that limits a single feed cycle to the amount of time set regardless of the calculated post feed %.
SOURCE - Select between cond. bleed, another timer or digital input as the time source.

4.6   With Bleed Timer

```
      >SYSTEM 1 TIMER 1 CHANGE<

LIMIT TIME
```

LIMIT TIMER - This timer starts when the conductivity bleed starts, and turns off when the bleed stops or until the limit time has been reached. The time can be set in MM:SS.

4.7   28-Day Timer

Each 28-day timer has Program 1-4 for programming the various feed times. While the programming steps for four programs are the same, each can have its own independent settings.

```
      >SYSTEM 1 TIMER 1 CHANGE<

WEEKS                   MIN COND
DAYS                   FEED LOCK
START TIME            BLEED LOCK
RUN TIME              FLOW LOCK
PREBLEED              ORP  LOCK
```

WEEKS - The week(s) that the timer is to feed.
DAYS - The day(s) that the timer is to feed.
START - The time of day for the timer to start.
RUN - How long the timer is to run.
PREBLEED - How long the controller is to bleed down before feeding in chemical. **NOTE:** The prebleed starts at the START time programmed above.
MIN COND - The minimum conductivity that the unit will prebleed down to.

FEED LOCK - Which other system timer to lockout during this timer's run time.
BLEED LOCK - How long to lock out the bleed function after the timer's run time starts.
FLOW LOCK - 3 selections if a system has a flow switch:

• Only With Flow - If there is no flow at the start time no feed occurs.

• With or Without Flow - Feed occurs regardless of flow condition.

• Flow Only/Store1 - If there is no flow at the start time, one run cycle will occur when flow does come on. Only one run will occur regardless of how many more than 1 are missed due to no flow.

NOTE: ORP lock is only for systems with the ORP function. If interlocked the ORP set point will switch to the 2nd setpoint for control during the timer's programmed RUN time. The feed device must be connected to a relay activated by the ORP setpoint/control function.

5.   Customize

This menu allows the user to define the on-screen name of the unit plus the name of each system and relay. The user can also setup the Notepad for each system and 4-20mA Input's name and unit of measurement.

```
           >CUSTOMIZE<

UNIT NAMES
RELAY NAMES                  NOTEPAD
SYSTEM 1 NAME             pH INDEX
                           mA IN
                      RUN SCREEN
```

RUN SCREEN - Allows the user to select what will be shown on the screen while the controller is in RUN mode. Like displaying temperature readings, water meter totals for a particular system or the conductivity units of measure.

NOTE: When entering values for custom names, use the numerical keys for numbers and the up / down arrows to scroll through all the characters of a keyboard. Press the right arrow to advance the curser after setting a desired value. Press the Help button to place the last-entered character into the new cursor space to speed up the process. The Help button will also jump advance through the characters.

5.1   Notepad

The Notepad function allows the user to set up a customized manually entered data field for each system with ten notepad items. The NOTEPAD is ideal for setting up and storing into the controller's history the items typically tested for reporting a service call. The Notepad items come with no names but when an individual note is selected a menu for setting it appears.

Also can be used as a Reminder Timer with or without flow.

```
      >NOTEPAD SYS 1 NOTE 1<

  NAME

  NUMBER

  UNITS

  ALARMS
```

NAME - Pick from a list of defined names or customize your own.
NUMBER - Set the number range.
UNITS - Set the units of measurement.
ALARMS - Set Hi/Low alarm points and how frequently a new value is expected to be manually entered via the History menu.

5.2 mA Inputs

```
        >mA INPUT 1 CUSTOMIZE<

 NAME
 UNITS
 NUMBER
```

NAME - Name the input.
UNITS - Set the units of measurement.
NUMBER - Set the number range.

5.3 pH Index

If the controller has the pH index option (must have pH control) user can select LSI or RSI indexing. The controller will automatically set some Notepad entries for manually inputting needed data to perform the calculation which will be displayed in the RUN screens.

5.4 Run Screen

This lets you customize various aspects of the RUN screen.

```
          >RUN SCREEN<

 MAIN SCREEN
 SCREENS SHOWN
 CYCLE TIME
 COND UNITS
```

MAIN SCREEN - Customize what is displayed on the RUN screen.
SCREENS SHOWN - Pick if the mA input & Aux Flow screens are scrolled.
CYCLE TIME - The amount of time between screen scrolls.
COND UNITS - Select the units of measure to be displayed with the conductivity reading.

6. Alarms

```
           >ALARMS<

 SYS 1 ALARMS
```

ALARMS - Shows any current alarms.

7. Date and Time Set Up

```
       >SET DATE AND TIMES<

 SET DATE
 SET TIME
 SET DAY
 SET WEEK
 Friday May 14, 2005 03:04:56
```

DATE AND TIME - For setting the date, time, day and week on the controller.

```
              >CONFIGURE<

 PASSWORD                CONTRAST
 RELAYS                  TEMP SCALE
                         NETWORK
 HISTORY                 SYS INFO
 FLOW SW                 FACTORY
```

8. Configure

Provides access to menus to set-up passwords, relay activation, temp scale, display contrast, flow switch, input, history time stamps, factory set up and system information.

CONTRAST - This screen allows for adjusting the display contrast.
FLOW SW - Defines a flow switch to be open or closed with flow.
FACTORY - A factory only menu
TEMP SCALE - Set Celsius or Fahrenheit
HISTORY - Sets the history time stamp interval.
SYS INFO - Tells unit software specifics.

8.1 Password

```
       >CONFIGURE PASSWORDS<

ADMIN PASSWORD
USER PASSWORD
USER SET UP
```

ADMIN PASSWORD - The administrator password gives access to all menus except factory set up.
USER PASSWORD - The user password allows the user to access HOME menus that are made available in USER SET UP.

8.2 Relays

```
        >RELAY 1 SETUP<

MAIN ACTION           DISABLE 1
ACTIVATOR 2           DISABLE 2
ACTIVATOR 3           DISABLE 3
ACTIVATOR 4           DISABLE 4
DELAY                 DAILY MAX
```

CONFIGURE RELAYS - This menu lets you choose a **Main Action** or function (timer 1, conductivity, alarms, etc...) to activate a relay.

A pop-up screen appears with a list of all available activation functions to arrow through.

Additional relay logic is available with up to 3 additional **Activators,** and up to 4 **Disablers,** allowing multiple functions to activate the same relay, and multiple functions to prevent the relay from coming on. There is also a Daily Max amount of time that a relay can be on. If a relay is on for the max amount, it does not let the relay come on anymore that day (a 24-hour clock is used for the day with midnight being the start of the day). The Delay setting is the amount of time a control function must come on before the relay will react and activate. This is to prevent a relay from chattering on/off if a reading is bouncing around the set point or alarm.

8.3 History

This menu is used to set the history "time stamp" interval, the water meter daily history starting hour, the alarm delay period and the USB history save format.

```
      >CONFIGURE HISTORY<

INTERVAL
W/M HOUR
ALARM DELAY
SAVE FORMAT
```

INTERVAL - The amount of time between each history time stamp for probe readings.
W/M HOUR - The time of day that the daily water meter history cycle is to start.
ALARM DELAY - The amount of time an alarm has to be on before it is recognized as an alarm.
SAVE FORMAT - The USB history save format.

8.4 Flow Switch

This menu allows the user to select if a flow switch signal will represent a flowing condition when a "closed" or "open" signal is seen for each system's flow switch input. Users can also select if timers can work always or only with flow.

8.5   Contrast

This menu is used to adjust the contrast of the display.

8.6   Temperature Scale

This menu is used to select the type of temperature scale to display.

8.7   Network

The Network menu is used when a controller is being remotely communicated with either a local network connection or over the internet on the WebAdvantage server.

```
        >CONFIGURE NETWORK<

IP ADDRESS              HTTP REMOTE
IP MASK                        FTP
GATEWAY                      RESET
SERVER
HTTP LOCAL
```

NETWORK - This menu is used for setting up the remote WebAdvantage communications and is covered in a separate manual.

http://www.advantagecontrols.com/downloads/pdf/M-WebAdvantage.pdf

Note: The Network card must be RESET after making any changes to Network setting to save changes and reset communications.

8.8   System Information

System information will identify the version of firmware installed in the controller along with the controller's serial number.

9.   History

The onboard history allows for viewing the history of the probe readings, relay activations, key-pad activity, calibrations, water meter hourly and daily logs and alarms for each system present. It is also where Notepad data is entered and reviewed. An initial overview page is displayed showing your current sample interval, the calculated number of days the unit can keep probe history for before losing the oldest. The number of sensor samples and relay/alarm events and Notepad entries currently stored is also displayed.

```
          >HOME REVIEW<

SYSTEM 1        Sample Time: 5 MIN
               (Length 164.62 days)
                 Sensor Samples
                       882
                Relay/Alarm Events
                       323
                  Notepad Entries
```

NOTE: The history can be reset by going to the configure menu and entering a different sample interval. After the new sample interval has been set the onboard history is reset.

9.1 Viewing History

```
              >HISTORY<

RELAY LOGS              WATER METER
ALARM LOGS
SENSOR HISTORY
EVENT LOG
NOTEPAD
```

RELAY LOGS - Relay activations displayed in a log form. Arrow up to advance through the log.
ALARM LOG - Alarm activations in log form.
SENSOR HISTORY - For selecting the parameters and viewing of a given probe reading's history in log or graph form.
EVENT LOG - Displays various activities.

9.2 Notepad Entries

```
       >NOTEPAD: SYS 1 NOTE 1<

ENTER VALUE          Total Hardness
LOG                       8 Entries
GRAPH

                  517.2 Hrs to Alarm
```

The Notepad section under History is where the user goes to enter new values for the customized notepad items. Each individual notepad item's manually entered entries are stored in the unit's history and can be reviewed in log or graph form after 4 or more values have been entered.

9.3 Water Meter History

The water meter history allows the user to review both water meter one and two of a particular system in both an hourly format (for the past 24 hours) or a daily format for the past 60 days. If an evaporation calculation is being kept, a daily history of this value is also available.

10. Water Meters / Totalizers

Each system with a timer on it will have two water meter inputs. Each of these can have the incoming contact defined, allowing the controller to keep track of water usage. If desired, the controller can calculate evaporation loss by subtracting the difference between a system's two water meter inputs.

```
         >SYS1 WATER METER 1<

TOTAL VALUE:     0280500.0   GALLONS
FLOW RATE:        000.0 GALLONS/MIN
CONTACT VALUE:  0010.0 GAL/CONTACT
CONTACT VALUE                DEBOUNCE
CONTACT UNIT
RESET TOTAL                 EVAP CALC
```

CONTACT VALUE - Defines the numerical value for a contact, i.e., 10.
CONTACT UNIT - Defines the units of measurement for a contact, i.e., Gallons / Contact
RESET TOTAL - Resets the totalizer count.
**EVAP CALC** - Defines which way to subtract the 2 water meter inputs for an evaporation value.
DEBOUNCE - An additional amount of time the input will wait before accepting another water meter contact to reduce false contacts from a chattering read switch.

10.1 Option W Totalizers

```
           >FLOW METER<

FM01: AUX METER A
FM02: AUX METER B
FM03: AUX METER C
FM04: AUX METER D
```

MegaTron XS controllers with "W" option may have 1-4 auxiliary flowmeter inputs.   These additional inputs are for tracking various flow meter devices (additional water meters or flowmeters in a metering pump's discharge tubing). They can also be linked to a system's water meter input for additional tracking and alarm capabilities including: bleed

flow/no flow, exceeding too much flow in a 12- or 24-hour period. Units with Auxiliary Flow meter inputs have a Home menu selection for Totalizers. The Totalizer menu has selections for each of the System Water Meters plus one named Aux Meters.

```
          >TOTALIZERS<

SYS 1 WATER METER 1
SYS 1 WATER METER 2

                        AUX METERS
```
Select the system water meter to set up or go to Aux Meters to set up the auxiliary flow meters.
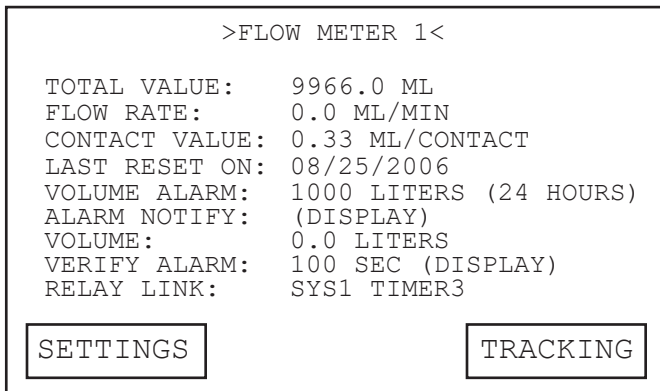

10.2   Aux Meters
A unit may have 1 to 4 Aux Meters. These additional inputs are for tracking various flow meter devices, like Advantage Controls' FloTracker, in a metering pump's discharge tubing. They can also be linked to a system's water meter input for additional tracking and alarm capabilities.
Select the Aux Flow Meter to set-up or review.

10.2a   Aux Meter Review
A review screen of the current settings is provided with a selection for the Tracking method and the Settings.

```
          >FLOW METER 1<

TOTAL VALUE:    9966.0 ML
FLOW RATE:      0.0 ML/MIN
CONTACT VALUE:  0.33 ML/CONTACT
LAST RESET ON:  08/25/2006
VOLUME ALARM:   1000 LITERS (24 HOURS)
ALARM NOTIFY:   (DISPLAY)
VOLUME:         0.0 LITERS
VERIFY ALARM:   100 SEC (DISPLAY)
RELAY LINK:     SYS1 TIMER3

 SETTINGS              TRACKING
```

SETTINGS - Access the various settings for the flow meter.

TRACKING - Provides a pop-up screen to select either FloTracker or Rate and Volume tracking.

NOTE: Select FloTracker if the aux meter is a pump flow meter. Select Rate and Volume if tracking a water meter or other batch flow device.

10.2b   Aux Meter Settings

```
        >FLOW METER 1 SETUP<

PULSE VALUE            VOLUME ALARM

UNITS                  RESET VOLUME

RESET TOTAL

VERIFY ALARM

RELAY LINK             METER LINK
```

PULSE VALUE - Defines the numerical value for a contact, i.e., 225.

UNITS - Defines the units of measure for a contact, i.e., Pulses / Ounce.

RESET TOTAL - Resets the totalized count of the meter.

VERIFY ALARM - If a flow meter is linked to a control relay the controller will give an alarm if it does not receive a contact or pulse from the aux meter within the amount of time defined or if it gets a contact when the relay is not on.

RELAY LINK - The relay link informs the aux meter input is relevant to the control function that the selected relay is being driven by. For example, if the aux flow meter is a metering pump's FloTracker, then it should be linked to the relay that is driven by the feed timer that pump will be controlled by. If the aux meter is going to be linked to a water meter in a bleed off line, then it should be linked to the relay that is controlling the bleed off valve.

VOLUME ALARM - If FloTracker has been selected as the Tracking method, an alarm will occur when the defined VOLUME USED has passed through the flow device.

Note: If Rate and Volume tracking has been selected, an alarm will occur if the defined MAX VOLUME amount is measured within the defined TIME CYCLE, which can be a 1, 3, 6, 12, or 24-hour period.

RESET VOLUME - Resets the Volume Alarm totalizer.

METER LINK – This selection only shows if the tracking method is Rate and Volume and tells the auxiliary flowmeter input to get its signals from one of the system water meters already wired to the controller's water meter inputs. If this is selected, no wiring to the auxiliary input is required and the PULSE VALUE and UNITS settings are auto populated from the water meter's settings.

11.   Relays

```
           >RELAYS<

  STATUS
  RESET
  FORCE
```

STATUS - Allows for viewing accumulated relay ON times, temporary forcing relays ON or OFF or seeing   which relay is on.
RESET - Allows the accumulated run time of a particular relay to be reset to zero.
FORCE - Allows a relay to be manually forced ON for a single event from 0-99 minutes. When the event is over the relay goes back to its normal automatic control.

```
         >RELAY STATUS<

  R01:  ON            006:30:30
  SYS1  COND BLEED
  R02:  OFF           008:56:35
  SYS1  pH
  R03:  OFF-T         011:00:10
  SYS1  TIMER1 INH
  R04:  OFF           007:00:00
  SYS1  TIMER2 BIO1
  R05:  OFF           008:10:30
  SYS1  TIMER3 BIO2
```

In the STATUS view the accumulated ON time is shown along with the main activator, custom name, and current status:
ON = Relay on by relay activators
OFF = Relay off by normal logic
OFF-T = Relay off for daily max
OFF-D = Relay off for relay disabler
ON-A = Relay activated by activator other than main action
H-ON = Relay manually forced on
H-OFF = Relay manually forced off

VI. Maintenance

The only required maintenance for normal, uninterrupted operation of your MegaTronXS controller is cleaning of the electrode(s). After initial startup, it is a good idea to clean the electrode frequently until a schedule based on need has been developed. Since each application is unique, it is difficult to estimate the required frequency of cleaning. The first cleaning should take place after about one week of the system being online.

To determine the required cleaning frequency, record the reading on the controller before the electrode is removed for cleaning. After cleaning, record the new reading. If a change is observed in the two readings, the electrode is dirty. The more significant the change, the dirtier the electrode. If no change occurs, cleaning needs to be done less often.

Conductivity Electrode Cleaning Procedure

1. Record the current conductivity reading.
2. Turn off water flow through the electrode loop, bleed pressure from the line and remove electrode.
3. Use a clean cloth and a mild cleaning solution to remove loose dirt etc., from the flat surface of the electrode.
4. If the electrode has deposits such as scale attached to the electrode surface a more aggressive cleaning approach will be needed. There are several ways to do this, the preferred method being the one that is easiest for the user.
- Use a mild acid solution to dissolve deposits.
- Lay a piece of sandpaper (200 grit or finer) on a flat surface such as a bench top.   Sand   electrode   to remove stubborn deposits Do not wipe surface with your finger. Oil from your skin will foul carbon tips.
5. Reinstall the electrode in the system. After the reading stabilizes, calibrate the unit to a reliable test reading.

Many times, an electrode can appear to be clean, but the unit still cannot be calibrated. If this is the case, use one of the more aggressive electrode cleaning procedures listed in step 4 above. Recheck the calibration after completion of this procedure. If no change was observed in the reading, replace the electrode. If a change occurs but the unit still will

not calibrate, repeat procedure as many times as necessary.

pH and ORP Electrode Cleaning Procedure

1.   Remove the pH electrode from the system.
2.   Spray with water and/or detergent, using a soft brush to dislodge any fouling.
3.   Visually inspect the electrode for signs of damage.
4.   Calibrate the electrode while it is in a known solution.

Slow response or non-reproducible measurements are signs that the electrode has become coated or clogged. The pH glass is susceptible to mounting by many substances. The speed of response, normally 95% of the reading in less than 10 seconds, is dramatically degraded when the pH glass is coated.

To restore the speed of response for a pH electrode, clean the bulb with a high-quality detergent, methyl alcohol or other suitable solvent using a Q-tip. Rinse well with distilled water and retest. If the electrode now responds, but erratically, soak the sensor in 0.1 Molar HCl for 5 minutes. Remove and rinse with water and place in 0.1 Molar NaOH for 5 minutes. Remove, rinse again and then place the sensor in pH 4. buffer for 10 minutes before use.

VII. Troubleshooting

The MegaTronXS controller has been designed for many years of trouble-free operation. Should a problem occur, refer to the following chart to help identify the problem. If replacement is required, follow the procedures listed in the Warranty and Factory Service portion of this manual.

SYMPTOM	POSSIBLE CAUSE	SOLUTION
False reading	Bad or dirty electrode. Out of calibration.	Clean as needed. Calibrate unit.
Will not calibrate	Dirty electrode. Faulty calibration (set to 0). Faulty electrode Faulty wiring to electrode	Clean electrode. See "Reset 0" menu (pg. 18). Replace electrode if needed. Replace wiring if needed.
No system power	Check power source. Check fuse. Check connections	Plug into different receptacle. Replace as needed. Make sure ribbon cables are secure.
Pulse timer not activating	Check wiring. Check external device.	Repair as needed. Repair/replace as needed.
Relays not energized	No flow. Check fuse. Ribbon cable loose	Check for clogged pipes or strainer. Replace as needed. Reseat ribbon cable between relay and motherboards.
Display blank or resetting	Ribbon cable loose.	Reseat ribbon cable between display and motherboard at each end.
USB not recognized	Ribbon cable loose.	Reseat ribbon cable between USB board inside front panel and motherboard.

VIII. Advantage Controls' Product Warranty

Advantage Controls warrants control systems of its manufacture to be free of defects in material or workmanship. Liability under this policy extends for 24 months from the date of installation. Liability is limited to repair or replacement of any failed equipment or part proven defective in material or workmanship upon manufacturer's examination. Removal and installation costs are not included under this warranty. Manufacturer's liability shall never exceed the selling price of equipment or part in question.

Advantage disclaims all liability for damage by its products caused by improper installation, maintenance, use, or attempts to operate products beyond their intended functionality, intentionally or otherwise, or any unauthorized repair. Advantage is not responsible for damages, injuries or expenses incurred through the use of its products.

The above warranty is in lieu of other warranties, either expressed or implied. No agent of ours is authorized to provide any warranty other than the above.

30 Day Billing Memo Policy

Advantage Controls maintains a unique factory exchange program to ensure uninterrupted service with minimum downtime. If your controller malfunctions, call 1(918)-686-6211, provide our technician with Model and Serial Number information. If they are unable to diagnose and solve your problem over the phone, a fully warranted replacement will be shipped, usually within 48 hours, on a 30-Day Billing Memo.

This service requires a purchase order, and the replacement is billed to your regular account for payment.

The replacement will be billed at the current list price for that model less any applicable resale discount. Upon return of your old panel, credit will be issued to your account at either 100% if your unit is in warranty or at 50% if your unit was out of warranty. The exchange covers only the panel. Electrode and enclosure are not included.

FCC Warning

This equipment generates and uses radio frequency energy and if not installed and used properly, that is, in strict accordance with the manufacturer's instruction, may cause interference to radio communications. It has been type-tested and found to comply with the limits for a class A computing device pursuant to subpart J of part 15 of FCC Rules, which are designed to provide reasonable protection against such interference when operated in a commercial or industrial environment. Operation of this equipment in a residential area is likely to cause interference in which case the user, at his own expense, will be required to take whatever measures necessary to correct the interference.

XS Controller - USB Functions

The XS is capable of transferring information using a FAT formatted USB drive. The XS has three main USB functions as detailed in the following sections:

1. Exporting log data
2. Upgrading firmware
3. Cloning user settings for other XS units

Getting Started

With the controller powered up, plug the USB drive into the XS USB port. The USB DRIVE DETECTED pop-up window will appear.

Notes:
• You may be required to enter a password.
• USB drives must be FAT formatted.
• Not all customized names will be saved.

Exporting Log Data

History from an XS controller can be saved to a USB drive in one of two file formats: WebAdvantage or generic comma separated (default).

Comma Separated Format with header row

WebAdvantage Format without header row

Sample Log Data "log.txt" files

To change formats, see Step 2.

Step 1:
To transfer the contents of the XS history logs to the USB drive, select → **History** → **USB** by using the Arrow buttons. Then press ENTER.

```
              XS Controller
  ┌─────────────────────────────────────┐
  │ USB DRIVE DETECTED                   │
  │                                      │
  │      --> History --> USB             │
  │                                      │
  │ PRESS UP/DOWN KEYS TO CHANGE         │
  │ PRESS ENTER TO ACCEPT                │
  └─────────────────────────────────────┘
  ORP:      548      mV      │ FLOW: ON
  ┌ 3 ALARMS! ┐ DR ┌ RELAYS ┐
  Friday, February 6, 2015   15:50:47 Wk1
```

Note: Status will be displayed on the screen to show the percent completed of each log record type. Once the log is completely stored, the pop-up window will close. If only a small amount of data is available the screen may disappear quickly. The USB drive will now contain a file name: example "LOG_AB-1234.TXT". The AB-1234 will be the unit's serial number.

Step 2: Changing the File Format
This is the **RUN** Screen.

```
              XS Controller
  SYS1:   Towers 1-4
  COND:              0 uS/cm   TEMP1:  68°F
                               WM1:    0.0
                               WM2:    0.0
  pH:        3.2
  ORP:     548      mV         FLOW: ON
  ┌ 3 ALARMS! ┐ DR ┌ RELAYS ┐
  Friday, February 6, 2015   15:50:47 Wk1
```
Step 3:
Push the **SET UP RUN** button to get this screen. From here push **CONFIGURE** (Button 7) to go to the next screen.

```
              >HOME SETUP<
  SETPOINTS                    DATE/TIME
  CALIBRATION                  CONFIGURE
  TIMERS                       HISTORY
  CUSTOMIZE                    WATER METER
  ALARMS                       RELAYS
```

XS Controller - USB Functions

Step 4:
This is the Configure Screen. From here push **HISTORY** (Button 4) to go to the next screen.

```
            >CONFIGURE<

PASSWORD                 CONTRAST
RELAYS                 TEMP SCALE
                          NETWORK
HISTORY                  SYS INFO
FLOW SW                   FACTORY
```

Step 5:
This is the Configure History Screen. From here push **SAVE FORMAT** (Button 4) to go to the next screen.

```
        >CONFIGURE HISTORY<

INTERVAL
W/M HOUR
DELAY
SAVE FORMAT
```
Step 6:
Set the value of the **HISTORY SAVE FORMAT** by using the arrow keys. Then press **ENTER** to confirm and go to the previous screen.

```
        >CONFIGURE HISTORY<

IN┌─────────────────────────────┐
W/│ HISTORY SAVE FORMAT         │
DE│      --> WEB ADVANTAGE      │
SA│ PRESS UP/DOWN KEYS TO CHANGE│
  │ PRESS ENTER TO ACCEPT       │
  └─────────────────────────────┘
```

Note: WebAdvantage format is required for uploading history to WebAdvantage for cloud storage and graphing. Change to Comma Separated format if using a database software like Excel.

Press **SET UP RUN** to return to the RUN screen.

Step 7:
Remove USB drive and re-insert to initiate the USB DRIVE DETECTED pop-up window. Repeat Step 1 from section *Exporting Log Data*.

Uploading data to WebAdvantage

If the controller does not have a communications card you can purchase WEBADV-XSCLOUD storage of your unit's history. This one-time fee per controller allows the XS history to be stored on WebAdvantage for using custom graphing and multiple user internet access. Contact Advantage Controls or support@advantagecontrols.com with your unit's serial number to learn more.
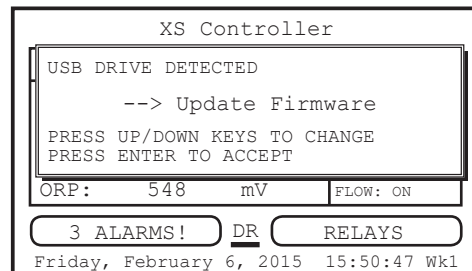

After an XS is set-up for cloud storage, follow these steps:

1. Login to the secure web server: https://webadvantage.online
2. Locate the controller you have data for and click **Reports**
3. Click **History Upload** on the left
4. Click **Choose File** and select the file you exported.
5. Click **Submit** and the data will upload
6. You will now be able to view reports and history data once completed.

Upgrading Firmware

To upgrade the firmware on your XS, copy the updated software version to a USB drive. The file name should be "firmware.bin" With the controller powered up, plug the USB drive into the XS USB port. The USB DRIVE DETECTED pop-up window will appear. If a password is in the unit, the USB will ask for it.

Select **--> Update Firmware** by using the Arrow buttons. Then press ENTER.

```
            XS Controller
┌───────────────────────────────────┐
│ USB DRIVE DETECTED                 │
│      --> Update Firmware           │
│ PRESS UP/DOWN KEYS TO CHANGE       │
│ PRESS ENTER TO ACCEPT              │
├───────────────────────────────────┤
│ ORP:     548      mV    │ FLOW: ON │
├──────────────┬────┬───────────────┤
│  3 ALARMS!   │ DR │    RELAYS     │
│ Friday, February 6, 2015  15:50:47 Wk1 │
└───────────────────────────────────┘
```

Warning: Do not remove power or USB during updating. It may take a few minutes to complete. Once the first update is complete, power off and remove USB. Wait 20-30 seconds to power back on and reinstall the USB after the RUN screen appears and load the firmware a second time.

XS Controller - USB Functions

After second update is complete, power down and remove USB. Power back on (after 20 seconds) and go to the Configure menu.

```
            >HOME SETUP<

SETPOINTS              DATE/TIME
CALIBRATION            CONFIGURE
TIMERS                   HISTORY
CUSTOMIZE            WATER METER
ALARMS                    RELAYS
```
From here push **SYS INFO** (Button 9) and confirm that the unit now has the new version and that the CARD version is also current (consult factory for current).

```
    SYSTEM INFORMATION:
    XS MEGATRON CONTROLLER
    ADVANTAGE CONTROLS INC.
PAS FRMWARE REV: KA.10.03A Jan 29 2018
REI S/N:  SERIAL#
    CARD VER: 5

HISTORY                  SYS INFO
FLOW SW                   FACTORY
```

⚠ **Warning:** If the card revision has not updated to the newer version, the sensor function will not work correctly. A few power cycles may be needed to get the system card updated. The mA input and communications card (if present) may need to be removed with the power off and a power cycle performed. Once the system card version is updated, power back down and reinstall the mA and communications cards.

Cloning User Settings for other XS Units

The XS has the ability to copy the User Settings from one XS to another. This process is referred to as cloning.

Step 1:
With the controller powered up, plug the USB drive into the XS USB port. The USB DRIVE DETECTED
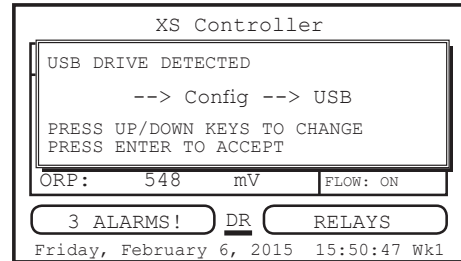

pop-up window will appear. Select → **Config** → **USB** (Config to USB) by using the Arrow buttons. Then press ENTER.

```
           XS Controller
 ┌─────────────────────────────────────┐
 │ USB DRIVE DETECTED                   │
 │                                      │
 │       --> Config --> USB             │
 │                                      │
 │ PRESS UP/DOWN KEYS TO CHANGE         │
 │ PRESS ENTER TO ACCEPT                │
 │                                      │
 │ ORP:    548     mV     ┌─────────┐   │
 │                        │FLOW: ON │   │
 │ ┌──────────┐  DR  ┌────────────┐     │
 │ │ 3 ALARMS!│ ──── │   RELAYS   │     │
 │ Friday, February 6, 2015  15:50:47 Wk1│
 └─────────────────────────────────────┘
```

The User settings will be saved to the USB drive under the file name "CONFIG.BIN". The pop-up window will close when the copy is completed.
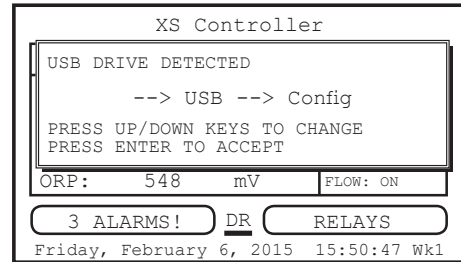

Step 2:
Plug the USB drive into the XS that you would like to copy the User Settings to. The USB DRIVE DETECTED pop-up window will appear.

Select → **USB** → **Config** (USB to Config) by using the Arrow buttons. Then press ENTER.

⚠ **CAUTION:** Do not choose → Config → USB again or you will save over your USB contained CONFIG.BIN file.

```
           XS Controller
 ┌─────────────────────────────────────┐
 │ USB DRIVE DETECTED                   │
 │                                      │
 │       --> USB --> Config             │
 │                                      │
 │ PRESS UP/DOWN KEYS TO CHANGE         │
 │ PRESS ENTER TO ACCEPT                │
 │                                      │
 │ ORP:    548     mV     ┌─────────┐   │
 │                        │FLOW: ON │   │
 │ ┌──────────┐  DR  ┌────────────┐     │
 │ │ 3 ALARMS!│ ──── │   RELAYS   │     │
 │ Friday, February 6, 2015  15:50:47 Wk1│
 └─────────────────────────────────────┘
```
The User Data will be loaded into the XS from the USB drive. Once the pop-up window closes, cloning has been completed.
Notes:
  • Not all customized names will be cloned.
  • If you have trouble reading clone files, insure that the XS you are cloning has current firmware.
